Comparing GUI and CLI is like comparing cake and celery. They're very different, but they're still both food and both have their own benefits.

GUI is the sweet cake of this comparison. It looks nice and is easy to get if you are a more visual person. This is what I use most and prefer. However, as nice as GUI is, it's nowhere near as fast as CLI.

CLI is the celery. It's fast, straight to the point, and plain in presentation. But not everyone likes celery. I don't like celery. It's stringy and bitter. In this way, working with CLI feels similar. Stringy in the way that you have to figure out the exact commands and type them perfectly. Bitter in the way it makes my brain when I mess up and don't know what the problem is or where I went wrong.

I love cake, but I realize the benefits of celery and appreciate them just the same. In this way, I prefer GUI as a more visual medium. However, I understand the function of the CLI system and its benefits.
